

KYTHER

OSINT Exposure Assessment

Subject	torvalds (username)
Case ref	KY-20260804-6965
Generated	04 Aug 2026 · 22:18 UTC
Scope	public sources · 6 analyzers engaged

OVERALL RISK MEDIUM · 48 / 100

Generated by Kyther on 04 Aug 2026 from **publicly available sources only**. Every finding carries a confidence level (CONFIRMED / PROBABLE / POSSIBLE); **POSSIBLE matches include false positives** and all findings must be **verified independently** before any reliance. No private, paywalled, or authenticated data was accessed. This is **not a background check** and was produced for authorized security research and portfolio demonstration. Subject identifiers are anonymized where shown.

Executive Summary

RISK	CONFIRMED ACCOUNTS	IDENTITY	BREACHES
MEDIUM · 48/100	110	Name + Location	no source

TOP RISK FACTORS

1	Account footprint (209 sites)	24.4
2	Real-name deanonymization (name + location)	15.0
3	Email address exposed	6.0

ASSESSMENT

The subject presents **medium-level public exposure** (48/100), driven primarily by an extensive confirmed account footprint (110 platforms) and a real name and location linkable to the handle. Breach exposure was not assessed, as no breach source is configured. Lower-confidence (POSSIBLE) matches are unverified and heavily discounted in the score.

Findings · Accounts

209 unique accounts across 2 source(s), grouped by confidence. Weight is each account's contribution to the footprint factor.

● CONFIRMED (110) — control-verified

Findings · Identity & Contact

Type	Detail	Source	Confidence
Email	t...@...org	GitHub commits	● CONFIRMED
Name	Linus Torvalds	Profile enrichment	● CONFIRMED
Location	Portland, OR	Profile enrichment	● CONFIRMED
Employer	Linux Foundation	Profile enrichment	● CONFIRMED

Methodology

Orchestration. The seed entity is dispatched to up to 18 analyzers that run concurrently; entities they discover (emails, domains, handles) pivot back in, depth-limited, and all findings are aggregated and de-duplicated.

Sources. Public, no-authentication data only — no paywalled, private, or authenticated sources are accessed.

Confidence. **CONFIRMED** = authoritative (control-verified match or structured API data); **PROBABLE** = a strong corroborating signal; **POSSIBLE** = an HTTP-status-code-only match, which includes false positives.

Risk model. $\text{Score} = \Sigma(\text{sensitivity} \times \text{confidence}) + 5 \cdot \ln(1 + \text{effective_accounts}) + \text{confidence-scaled bonuses}$, clamped to 0–100. Effective accounts weight each match by its confidence ($\times 1.0 / \times 0.6 / \times 0.2$).

Limitations. POSSIBLE matches are unverified and must be checked manually; breach assessment requires a keyed source; rate-limited enrichment can reduce coverage between runs, so scores reflect the data available at scan time; all scores are advisory and not a background check.

ANALYZERS ENGAGED THIS SCAN

email_basic, github_emails, holehe, profile_enrich, sherlock, username

APPENDIX A · RAW SCAN DATA

Email, phone, and URL values are redacted; usernames and display names are retained (consistent with the cover).

Output capped at 8,000 characters.
